MODULE-04

The Rorschach inkblot test

is a psychological assessment that presents ten ambiguous, symmetrical inkblots to examine personality, cognition, and emotional traits. Developed by Swiss psychiatrist **Hermann Rorschach** in the early 1900s, it analyzes how individuals perceive and interpret the images, with responses evaluated both qualitatively and quantitatively to reveal thinking patterns and unconscious aspects of personality.

Thematic Apperception Test (TAT) is a projective psychological assessment where individuals view ambiguous pictures and create stories about them. These narratives reveal

underlying thoughts, emotions, and personality dynamics. Developed in the 1930s by Henry A. Murray and Christina D. Morgan, the TAT is widely used to explore motives such as achievement, power, and intimacy. It serves both clinical diagnosis and research on personality

and motivation.
